Abstract (en)  
[origin: WO2009149688A1] The invention relates to a method for operating a navigation system (01), which comprises a navigation apparatus (02) and at least one data server (05), the navigation apparatus (02) particularly comprising: - an input device where operator commands and/or location information, particularly departure points and/or destination points, can be input, - a road system database, in which the road system of a defined geographical area is described, the road system database additionally including POI data records for describing points of interest (POI), - a signal reception unit for receiving position signals, particularly satellite signals, - a position determination unit which determines the current position from position signals, - an output device at which data can be output for the user, comprising the following steps: a) selecting a plurality of POI data records from the road system database of the navigation apparatus (02) based on a search profile input by the user, wherein an Internet address associated with the POI is stored at least in one POI data record, b) transmitting at least one query from the navigation apparatus (02) to at least one data server (05), wherein the query includes the Internet address associated with the POI and at least parts of the search profile input by the user, c) determining a profile search result as a function of the agreement and/or non-agreement of the transmitted search profile with the content of the Internet addresses transmitted with the query, d) retransmitting the profile search result from the data server (05) to the navigation apparatus (02).
