Abstract (en)  
[origin: WO2009121399A1] The invention relates to an apparatus (110) for performing at least one electrical or electromechanical function, preferably a communication function. The apparatus (110) comprises at least one housing (112) and at least one pushbutton (120). The housing (112) comprises at least one first hinge element (144), and the pushbutton (120) comprises at least one second hinge element (128). The first and second hinge elements (144, 128) are adapted to interact as a hinge (164) in an assembled state of the apparatus (110). In a preferred embodiment, the first hinge element (144) and the second hinge element (128) are adapted to allow for an assembly and/or disassembly of the hinge in a first position (160) and are adapted to prevent a disassembly in at least one second position (168), wherein the at least one second position (168) differs from the first position (160). The at least one second position (168) preferably comprises an operation position of the pushbutton (120).
