Abstract (en)

[origin: WO2009153083A1] The invention relates to a contact pin for an electronic circuit, having at least one ceramic circuit carrier, wherein the circuit carrier has at least one opening for receiving the contact pin, and the circuit carrier has electric contact surfaces in the region of the opening for receiving the contact pin, and wherein the contact pin is only elastically deformed during the insertion of the same into the opening. According to further improvements of the invention the contact pin may have an electric contact spring as a plug-in stop on the plug-in side in addition to or instead of the radial thickened regions, said plug-in stop being substantially configured in the manner of a circular sector, the outer surface thereof pushing onto the circuit carrier as the stop surface, or onto the end that is inserted through the opening in the circuit carrier, and can comprise a barbed hook that prevents a sliding out of the contact pin after inserting the contact pin through the opening.
