Abstract (en)

[origin: WO2009074159A1] A method for associating a slogan to a message exchanged between telephone terminals that provides installing a message managing program on a telephone terminal and starting said program. By using a forward service message the program attracts from a remote provider a data file that contains a determined number of slogans (numslog). After having loaded the data file in a local memory of the telephone terminal, the program is shifted to a stand-by mode waiting for a message being received/sent by the telephone terminal. When the program notices a message being received/sent by the telephone terminal it loads at the same time a slogan from the data file and associates it to a message being received/sent, assigning then the message and the slogan to the telephone terminal. The program checks furthermore, if the slogans in the data file are finished, and, in the affirmative, downloads a further data file containing a number of slogans from the remote provider. If the user is the addressee of the messages, the user displays the message and the slogan on a screen associated to the telephone terminal. Instead, if the user is the sender of the messages, after assigning the message and the slogan to the telephone terminal, it is sent to the addressee, that can display the message and the slogan on the screen associated to the receiving telephone terminal.
