Abstract (en)

[origin: EP2292980A1] The oven has plug-in modules (10, 11) e.g. grills, inserted into a cooking chamber (1). The modules engage between lateral lower and upper guiding units (7, 8) such that a tilting process of the modules is limited while pulling out the modules by attachment of the modules on the upper guiding unit. Latching elements (14, 15) are arranged on the upper guiding unit and plug-in modules, respectively. The latching elements engage with each other when the modules are pulled out under the tilting process and do not engage with each other when the modules are pulled out without the tilting process. The plug-in modules are selected from baking trays, backing dishes and grills.
