Abstract (en)

The invention regards a system for locking the adjustable hook of a hanger, for coats/jackets, pants hangers, lingerie and the like, of the type which can rotate around the axis of its shank and remain locked, in a removable manner, in two or more different angular positions. Such locking system is characterized in that the hook is equipped at the end of the shank with a block (10), which is stably inserted into the body of the hanger, said block is constituted by a capsule (1), closed by a bottom (2), containing an elastic thrust element (3), which has the function of retaining the aforesaid hook in the oriented position. Such oriented position is defined by the coupling of at least one tooth (5) projecting from the terminal portion of the shank (4), which is inserted in the capsule, in one of the slots made on the inner wall of the aforesaid capsule ( Fig. 2 ).
