Abstract (en)

[origin: EP2295690A2] The system has an elastic locking plate engaged on two housing halves (3, 6) and surrounded by a displaceable sliding element (20). Rectangular window openings are formed in tabs that correlate with latches and bearing pins on the housing halves. The tabs are bent or elongated using the displaceable sliding element that surrounds the locking plate such that bending of the locking plate causes the housing halves to be unlocked or locked. The sliding element is realized in a form of open hollow body with rectangular basic shape and a concave outer surface.
