Abstract (en)

[origin: EP2295928A1] The device has a motor unit for pivoting a canard fin (2) from a transport position to a deployed position, where the fin is arranged inside a body (7) of a projectile (1) in the transport position and arranged radial to the body of the projectile in the deployed position. The motor unit comprises a support finger (12) that exerts a pivoting torque directly on an arm (2b). The support finger comprises a locking stop for the arm when the fin is in the deployed position, where a position sensor is arranged close to the support finger and detects passage of a loop of a spiral spring.
