Abstract (en)

It comprises a frame (1) with an entry (4) and exit (5), through which the mean (3) to be printed or has been printed with a design, respectively enters and exits, fixed rotating cylinders (2) over which the cited mean (3) circulates, characterised in that it comprises a linear motor that controls the reciprocating motion, at least one rotating cylinder (10) firmly coupled to the mentioned linear motor, at least one support cylinder (14) joint to the frame (1) over which the cited mean (3) circulates, being the next cylinder after the rotating cylinder (10) and in a different plane to same (10) and at least one guide cylinder (15) that controls the movement of the mean (3) inside the machine, the support cylinder (14) is away from the rotating cylinder (10) when the movement of the mean (3) is away from the multisystem printing machine and approaching to the rotating cylinder (10) when the movement of the mean (3) is approaching to the multisystem printing machine.
