Abstract (en)

[origin: EP2299041A2] The device (1) has a housing (2) provided with a piston passage opening (14) with an edge of opening (15). The passage opening is connected to a cross-sectional area of a piston (6). The edge of opening forms a front end stopper (16) limiting an axial displacement of a cylinder (5). The cylinder is provided with a radially protruding section (8). A stopper element is arranged at an end (18) of a recess (4) turned away to the stopper and limits the displacement of the cylinder by a positive contact with the protruding section. A capsule-shaped attachment section is made of metal and plastic. The stopper element is selected from a molding, a locking element such as fixing bolt, and a locking plate.
