Abstract (en)

[origin: EP2299337A1] The receiver (1) has a frequency conversion unit (7) with a local oscillator stage (10) for supplying oscillating signals (Sm) at a determined frequency. A bandpass filter (5) filters intermediate signals (IF). The local oscillator stage is automatically configured by a control signal (Cm) from a processing unit (8) so that the frequency of the oscillating signals from the local oscillator stage is adapted in accordance with the frequency of the incoming radio-synchronous signals such that the intermediate signal frequency is within the bandpass filter frequency band. An independent claim is also included for a method for activating a radio-synchronous signal receiver.
