Abstract (en)

[origin: CA2721454A1] The invention relates to a cost-effective rail system which can be driven upon by a board. Since the rail system can be easily assembled and disassembled again, the path can be very easily varied. The rail system is disposed in a sloping manner for this purpose. This can be done by constructing the rail system on a mountain slope, for example. By way of a specially designed board for this purpose, a so-called riding board on which a person can stand, the person can then ride down the slope. The riding board comprises a braking system.
