Abstract (en)
[origin: DE102008030281B3] The method involves providing springs (3) on a transition belt (6) by removably sticking springs on sections of the transition belt, where the transition belt is provided with the springs as a winding coil (2). The springs are detachably connected with the transition belt, where the transition belt exhibits a surface contour adapted to the geometry of the springs. The springs are released from the transition belt. The springs are shifted into a groove (4) in element plates (5) for locking the element plates with one another. An independent claim is also included for a spring inserting device comprising a drive unit.
