Abstract (en)
[origin: WO2009146822A1] The invention relates to a printing press comprising at least one central impression cylinder with which a plurality of inking units are associated. A stock can be fed to the impression cylinder in the region between the first inking unit and the last inking unit along a feed path. The printing press further comprises an unwinding station from which the stock can be unwound. An accessible zone past which the stock can be guided is provided between the impression cylinder and the unwinding station. Sound-absorbing elements are disposed above and/or below the feed path.
