Abstract (en)

[origin: WO2009144191A1] The invention relates to an improvement in high-pressure turbines (10) of turbine engines, such as a turbojet, in which a housing (40) for driving the axial clearance of rotary blades (18) is provided. According to the invention, an annular member (5) having a predetermined flexibility is also provided, and has one end (51) attached to an annular bearing (24) and another end (52) arranged for simple axial bearing under a given pressure against the upstream portion (401) of the control housing (40). It is thus possible to avoid parasitic vibratory strains at the attachment points (45, 46) of the control housing to the outer casing (22) of the turbines, and to thereby prevent the occurrence of cracks.
