Abstract (en)

[origin: WO2009149802A1] The invention relates to a method for producing a multilayer coating (17) for reflecting radiation in the soft X-ray or EUV wavelength range on an optical element (8, 9) which is operated at an operating temperature (Top) of 30° or more, preferably of 100°C or more, particularly preferably of 150°C or more, in particular of 250°C or more, comprising the following steps : determining an optical design for the multilayer coating (17) which defines an optical desired layer thickness (n_{dop}) of the layers (17.1, 17.2) of the multilayer coating (17) at the operating temperature (Top), and applying the layers (17.1, 17.2) of the multilayer coating (17) with an optical actual layer thickness (n_B dB) chosen in such a way that a layer thickness change (n_{dop} - n_B dB) caused by thermal expansion of the layers (17.1, 17.2) between the coating temperature (TB) and the operating temperature (Top) is compensated for. The invention also relates to an optical element (8, 9), produced in particular according to the method described above, and a projection exposure apparatus comprising at least one optical element (8, 9) of this type.
