Abstract (en)

[origin: WO2009149936A1] The invention relates to a system and an method for the simplified operation of an automation system which links knowledge-based and/or empirical and historical data (16a, b, c) to real-time data (16d), in particular alarm messages and/or event messages, in cooperation with a control system (10), especially a process control system. Data (16a, b, c, d) and/or links (14) or references to data and/or process states are acquired and stored by means of a first data processing device and can be made available to at least one second data processing device for further processing via at least one allocated communication link, in particular a network or bus system.
