Abstract (en)
[origin: EP2301724A2] The dispenser (1) has a shaft (20b) for receiving a lock latch or a bit (4b). The latch or the bit is guided into and out of the shaft in a lower trajectory (3b). Guiding parts (2) are provided in the shaft. One of the guiding parts is designed as a flexible and resilient latching unit (12) or as a stop member (9). The latch or the bit is positively lockable with the stop member in an upper trajectory (3a), where the upper trajectory is selectively parallel to the lower trajectory or located at an acute angle. The dispenser is formed either from an extruded section or an injection molded part.
