Abstract (en)  
The present invention relates to a method of normalizing assay data, comprising: selecting a first population of assay data and a second population of assay data, wherein the first population comprises a dependent set of controls and the second population comprises an independent set of controls; obtaining a linear relationship between the independent set of controls and the dependent set of controls; and applying the linear relationship to the first population, thereby producing normalized assay data. The invention is of particular applicability to assays that use resonance light scattering particles.
