Abstract (en)
[origin: WO2009138784A2] A potty is provided, the potty comprises a seat portion having an upper surface which is ergonomically contoured to receive the bottom of a child when the potty is in an open state. The seat portion comprises a cavity for receiving waste from the child. A lid portion of the potty is configured to be connectable to the seat portion to form a seal therebetween when the potty is in a closed state. Securing means are provided to prevent relative movement between the lid portion and the seat portion when the potty is in a closed state. The seal is configured such that egress of any waste contained within the cavity is inhibited, irrespective of the orientation of the potty.
