Abstract (en)

[origin: WO2010007112A1] The method according to the invention for determining the degree service life end of a carrying means (5) of an elevator, wherein the carrying means (5) is routed over a drive sheave (20) and/or one or more return pulleys (1 - 4) and connects a cabin (8) to a counterweight (9), comprises the following steps: a) the carrying means (5) is subdivided into a plurality of sections (A1 - AN), b) for each of the sections (A1 - AN), a determination is made as to whether the section (Ai) passes by the drive sheave (20) and/or one or more of the return pulleys (1 - 4) during a trip, and if this is the case, a usage level (R(Ai)) representing the degree of service life use is increased accordingly.
