Abstract (en)

[origin: WO2010010023A1] The invention relates to an elevator system (100) comprising an elevator cabin (5), two vertical lateral guide structures (10), two counterweights (18) which can be moved along the guide structures (10) and a drive mechanism of its own. The elevator cabin (5) is connected to the counterweights (18) by load-bearing means (19). Flat drives (6) serve as drive mechanisms. The flat drives (6) are fixed to mutually opposite cabin sides (5.1, 5.2) of the elevator cabin (5), each flat drive (6) comprising a gear rim (7) which engages into complementary toothings (25) provided on the guide structures (10). A rotational movement of the gear rim (7) is thus converted into a vertical movement of the elevator cabin (5).
