Abstract (en)

[origin: WO201007242A1] Method for producing a three-dimensional shape from two assembled parts having varying elastic properties, characterized in that it comprises the following steps: applying steady tension to the part, termed the deforming part (1), which has the highest elastic properties; bonding the part termed the structural part (2), which has the lowest elastic properties, to the tensioned deforming part; and removing the tension from the deforming part, which then applies stresses to the structural part, in such a way as to deform the latter and create the desired three-dimensional shape.
