Abstract (en)  
[origin: WO2010003578A1] A motor vehicle having a rear hatch is already known from DE 10 2005 033 098, wherein a rear window is releaseably disposed in a cutout opening of the rear hatch. The aim of the invention is to provide a motor vehicle wherein the adjustment of a pivoting component of the motor vehicle relative to a body of the motor vehicle is simplified. The aim is achieved in that an adjusting component (17) is attached between the component-side end (15) of the hinge (7) and a mounting location (24) of the component (25), that an elongated hole (44) is formed in the adjusting component (17) for adjusting the location of the component (25) relative to the body (2), and that the elongated hole (44), having a mounting means (22) disposed therein, allows rotation about a second mounting means (21) in a predetermined range, so that the position of the mounting location (24) of the component (25) can be changed.
