Abstract (en)

[origin: WO2010004467A2] Device for holding a winch (6) or a motor of a roller shutter in a winding case closed at each end by an end plate, the winch being positioned inside the case near a first end plate comprising, in its central part, a support stud able to be fitted into a housing (12) in the winch casing (13); the casing (13) comprises an elastic means (E) of clamping the stud able to keep the winch (6) immobilized in terms of rotation relative to the end plate during carriage or after installation, particularly in order to absorb the torque resisting operation, while at the same time allowing an angular movement of the winch relative to the end plate for position adjustment purposes.
