Abstract (en)

[origin: EP2305081A1] The machine has a discharge unit (10) including lower and upper parts (11, 12) movable relative to a housing (5) between lowest positions (Hu1, Ho1) and highest positions (Hu2, Ho2) along adjusting paths (Su, So), respectively. A guide (15) is directly arranged at the housing to guide the lower part along one of the paths (Su). A stopper (17) is designed such that the stopper holds the upper part at one of the lowest positions (Ho1) and the lower part is movable downwards relative to the upper part if the lower part is provided in a lower section (DSu) of the former adjusting path.
