Abstract (en)

[origin: WO2010000951A1] The invention relates to a system for opening/closing a lid (2), that comprises a flap (4) pivotally mounted about an axis (8) and an actuation means including at least one pusher (5a, 5b) mounted on a position-return means (6), a bearing surface, and first and second elastically deformable effectors (7, 7') each interacting with a stop (11, 11') formed on the flap (4) so that a first pushing force applied on the pusher (5a, 5b) brings the first effector (7, 7') in contact with a first stop (11, 11') and rotates the flap (4) from the closed or open position thereof into the other position, and so that a second pushing force applied on the pusher (5a, 5b) brings the second effector (7, 7') into contact with the second stop (11, 11') in order to bring the flap (4) into the initial position thereof, and a return means (15) connecting the lid (2) and the flap (4), which is compressed during the initial rotation phase of the flap (4) and extends almost completely at the end of the pusher (5a, 5b) movement.
