Abstract (en)
[origin: WO2009149707A1] The invention relates to a screening arrangement comprising a plurality of tiltable slats adapted to at least partly screening an aperture of the frame, and a tilt cord connected to a tilt assembly accommodated in said top element and to said slats, a means in connection with said tilt cord for tilting said slats between a first and a second predetermined position, wherein a first and a second assembly members interact and provide a rotation of said first assembly by moving said second assembly member between a first and a second end position corresponding to the first and second predetermined position, respectively, of said slats.
