Abstract (en)

[origin: WO2009149708A1] The invention relates to a screening arrangement comprising a plurality of tiltable slats adapted to at least partly screening an aperture of a frame, and a tilt cord connected to said slats and a tilt assembly accommodated in said top element and being movable in the longitudinal direction of said top element between a first and a second end position, and a tilt assembly comprising a locking mechanism adapted to connect said operating cord to said tilt assembly, and in that said locking mechanism has a locking condition allowing said operating cord to move said tilt assembly between said first and second end positions, and an unlocking condition wherein said operating cord is movable in said longitudinal direction of said top element without moving said tilt assembly.
