Abstract (en)
[origin: WO2010015349A1] The invention relates to a nail (1) for processing using a nail gun, having a pointed region (2), and a transitional region (4) adjoining the same, in which the cross-sectional surface A expands starting at the pointed region (2), wherein the nail (1) has a base body (8) comprising a round, particularly circular cross-sectional surface A. The cross-sectional surface A is reduced in the transitional region (4), but not in the pointed region (2), by means of flat portions (7) extending in the longitudinal direction. In order to create such a nail (1) having improved driving and holding properties, the invention provides that the cross-sectional surface A comprises circumferential sections (9) that are arched toward the outside, and are particularly semi-circular, across the entire length L of the flat portions (7) between the flat portions (7).
