Abstract (en)  
[origin: EP2309082A2] The door guard (1) has a sensor device (10) for detecting a pivoting position of an operating element (8) in a fixed pivoting area. A controller (11) switches the door guard between a monitoring condition, a prealarm condition and an alarm condition depending on the detected pivoting position. The sensor device has a pivoting lever (13) pivotably supported around an axis (14), where the lever projects over a housing (9) and stands in effective connection with the operating element such that pivoting of the lever takes place in the pivoting area by pivoting the operating element.
