Abstract (en)

[origin: WO2010005294A1] A lens to be added to a LED is manufactured by introducing liquid acrylate basic material into a mould with a suitably modelled mould cavity. The mould is embodied in material transparent to UV radiation, such as silicone rubber. After injection of the acrylate basic material into the mould, irradiation of the mould takes place with UV radiation such that the acrylate basic material cures to form a lens of the desired form. After curing of the material the mould is opened and the obtained lens is removed.
