Abstract (en)
[origin: EP2311575A2] The dispenser has a cap (70) and an operating handle (30) connected with each other such that displacement of the handle is mechanically blocked when the cap is arranged at a protecting position. A blocking member (32) is movably provided opposite to an outer housing (10), where movement of the blocking member is opposite to movement of the handle in the outer housing. The blocking member is extended in an operating condition of the handle through a recess (22) of the outer housing in the cap region, where the cap is arranged at the protecting position in the cap region.
