Abstract (en)

It comprises a plurality of vertical slats (2) susceptible to moving in a vertical direction through lateral guiding means (3). It is characterised in that the guiding means comprise a plurality of lateral guides (3) parallel to each other, each of which is associated to a slat (2), each slat (2) being susceptible to moving along its corresponding guide (3), in such a manner that in their retracted position the slats (2) are disposed parallel to each other, occupying a minimum amount of space. A blind having greater wind resistance is obtained, with a box that occupies very little space, and which fulfils all the regulations in force.
