Abstract (en)  
[origin: GB2462664A] A formulation for a two-phase management of wound healing comprises:- a substrate containing a rapid release form of a first active agent in the form of an inclusion complex with a cyclic molecule, preferably a cyclodextrin, the active being accommodated in a cavity of the cyclic molecule, and- at least one sustained release form, preferably microcapsules, of a second active agent which is released to the wound in response to a trigger by a wound constituent. The formulation can be applied directly to a wound or formulated into a dressing for application to a wound.
