Abstract (en)

[origin: WO2011015284A1] The invention relates to a method for obtaining constant weight slices or portions of slices from food products sliced by a cutting device, particularly a high-performance slicer, wherein a majority of cross-sectional areas  $F_i$  of the product are determined for at least one product to be sliced, particularly according to the light section method, the total weight  $G_{ges}$  of the product is determined, control data are calculated using the cross sectional areas  $F_i$  and the total weight  $G_{ges}$ , and the cutting device, particularly a product feed of the cutting device, is at least partially operated using the control data, wherein a weight table  $G_{bis}(i)$  for calculating the control data is created solely from the cross-sectional areas  $F_i$  and the total weight  $G_{ges}$  according to  $G_{bis}(i) = G_{bis}(i-1) + G_i$ , wherein  $G_i = G_{ges} * F_i / F_{ges}$  and  $i = 1$  to  $n$ .
