Abstract (en)
[origin: EP2316321A2] The handle (1) has a movable part (2b) that is moved relative to a wall mounted stationary part (2a), and slotted lever guides provided between the movable and stationary parts. The slotted lever guides guide the movable part to folded up and hinged down positions in a positively defined motion sequence corresponding to non-rotational movement about a rotational axle that is in stationary position during up-or down flaps. The slotted lever guides define a movement space in a sliding path through end position of sliding blocks.
