Abstract (en)

[origin: EP2316751A1] The device has coating panels (10) including peripherals return lines (12) extending perpendicularly or at an angle with respect to cores along a direction of a storing structure. The panels are butted together by joining the return lines, and are fastened together at the level of the return lines using a fixation element (3). The panels are welded together by a weld bead (40) at the level of a joint (4) of the cores. The fixation element comprises an adjustment unit i.e. threaded rod, to adapt separation distance of the panels to a surface (2) of the structure. The coating device is made of stainless steel. The weld bead is realized using Metal inert gas or Tungsten inert gas methods.
