Abstract (en)

[origin: EP2317265A2] The exchanger has a collector (1), and another collector (2) lying opposite to the former collector. Exchanger tubes (3) are stacked in a height direction over height (h) of the exchanger. Partial amounts (A, B) of the tubes are stacked in the height direction at over partial heights (h1, h2). Low and high temperature sections are attached to the assigned to the partial amounts of the tubes. The high and low temperature sections are assigned to two fluid circuits with different temperatures. Ratio of one of the partial heights to another one of the partial heights ranges between 0.2 and 0.4.
