Abstract (en)

A fused interlocked socket (1) with rotary disconnect switch has a front body (2) adapted to contain a base frame to which a contact holder body (4) is applied. The contact holder is wired to a socket (5) that is associated with the front body. The socket has a locking means, which prevents the insertion and disconnection of a plug when electric voltage is present in the system. The locking means is driven by a control knob (3) which is mounted on a door (8) that is hinged to the front body and is provided internally with a fuse holder body (9).
