Abstract (en)

[origin: WO2010010262A1] The invention relates to a device (1) for temporarily closing an openable panel on a bearing member (32), which can maintain said panel temporarily closed in relation to the bearing member (32). The device includes a body (4) bearing means for removably attaching same to the bearing member (32), as well as a protruding part (5) capable of being at least partially inserted into a cavity formed in the panel and of co-operating with an edge of the cavity in order to lock the panel in the closed position. The device is characterised in that it also includes means (51, 52, 53, 54, 46, 47) for guiding the translational movement of the protruding part (5) relative to the body (4) so as to enable adjustment in the closed position of the panel relative to the bearing member (32). The invention is suitable for use in the automotive industry.
