Abstract (en)

[origin: EP2319349A1] The device has a female element (2) with a traversing recess (11) in which an actuator (15) is arranged in a sliding manner. The actuator is maintained in a rest position to support against a stop plate (20) by the elastic action of a spring (18). The actuator has a cavity (16) partially aligned with a V-shaped free end (22) of the recess in the position. The actuator has a locking lip cooperating with an oblong opening (9) of a tab (8) of a male element (1). The lip is engaged in the opening under the action when the tab is introduced in the cavity via a lateral opening of the female element.
