Abstract (en)

[origin: EP2320010A1] The device (11) has an elongated panel with a lower orifice to allow a passage of threaded rod of a fastening bolt (27) screwed in a threaded orifice of a plate (18). The plate is located at a side same as a base plate (13) relative to the panel. The panel has dimension characteristics, such that small and large dimensions are lesser and greater than width of a longitudinal opening (9) of a C peg (5) to insert the plate inside the peg and rotate the plate about quarter turn in the peg behind inner faces of strokes until the plate forming a nut is blocked by inner faces of wings of the peg. An independent claim is also included for a method of positioning a control rod fixing device.
