Abstract (en)

[origin: WO2010015232A1] The invention relates to a method and to a device for transferring a substance between closed systems (G1 G/Z, Z, G+G/Z), which prior to the transfer are connected in a sterile manner and can be disconnected from each other in a sterile manner, and wherein means for transferring the substance are provided. The goal is to enable a contamination-free transfer of the substance without gas inclusions between closed systems. This is achieved with respect to the method in that the pressure differences occurring during the transfer of the substance are compensated for within the system. This is achieved with respect to the device in that a pressure compensating unit (1) is provided, which has a sterile flow connection to at least one system (G, G/Z, Z, G+G/Z).
