Abstract (en)

[origin: WO2010002341A1] A device for closing of a container (1) comprising a closure. The device comprises a container made of a rigid material, wherein the container has side parts (2), a bottom part (3) and an upper part (4). The upper part (4) has at least one gable folding for forming a spout, wherein the upper part (4) has first and second upper panels (5, 6), which are opposite and leaning toward each other, for forming the closure. The device further has a clamp (21), which is slidably arranged in recesses (22) along the closure of the container, which recesses (22) are arranged along the closure. The recesses (22) are arranged for guiding the clamp (21) between a first position and a second position in the recesses, between a opened and a closed state of the container (1) respectively, during infolding and unfolding of the gable folding respectively.
