Abstract (en)
[origin: WO2010029238A1] The invention relates to a device for the radiofrequency ignition of an internal combustion engine, made up of a power supply circuit (2) comprising a transformer (T) a secondary winding of which is connected to at least one resonator (1) that has a resonant frequency in excess of 1 MHz and comprising two electrodes able to generate a spark to initiate combustion of a combustible mixture in a cylinder of the engine in response to an ignition command, characterized in that it comprises: - a measuring capacitor (CMES) connected in series between the secondary winding and the resonator, - a measurement circuit (40) for measuring a current (IION) at the terminals of the said measuring capacitor, the said current providing an electrical image of how combustion is progressing, - a protection circuit (30) connected between the capacitor and the measurement circuit and designed to spare the said current measurement acquisition time from the electrical effects caused by the ignition command.
