Abstract (en)

[origin: WO2010025910A1] The invention relates to a method for measuring the interior of an elongated body (1, 2), which has a longitudinal axis x in a global xyz coordinate system, a laser profile scan being carried out, during which a laser scanner (6) carrying out scans in a plane is moved through the interior, characterized in that the scanning plane (8) is tilted at a tilt angle α about the y-axis and/or a tilt angle γ about the z-axis, preferably about the y-axis and the z-axis, out of the global coordinate system of the interior.
