Abstract (en)
[origin: WO2010019306A1] An apparatus in an example comprises a seat, a torso support, and a connector. The seat comprises a rigid core. The torso support is coupled with the seat. The connector is coupled with the seat and/or the torso support. The connector is removably connectable with an accessory that serves to at least in part support a weight of a patient relative to a load-bearing surface. A location of the patient on the seat with a front of the patient faced toward the torso support and the connector coupled with the accessory allows control by a caregiver of an upper body of the patient for and during transfer of the patient by the caregiver from a start location to a target location.
