Abstract (en)
[origin: WO2010015401A2] The present invention relates to a method for relaxing a strained material layer, comprising depositing a first low-viscosity layer comprising a first compliant material on the strained material layer, depositing a second low-viscosity layer comprising a second compliant material on the strained material layer to form a first sandwiched structure and subjecting the first sandwiched structure to a heat treatment such that reflow of the first and the second low-viscosity layers is caused thereby at least partly relaxing the strained material layer.
