Abstract (en)

A container (2) for containing a liquid such as water comprises fluid outlet means (10) having a hole (13) for allowing fluid to escape. A surface (12) defining the hole (13) is provided with at least one recessed portion (11). On the basis of the presence of the recessed portion (11) as mentioned, it is achieved that when the hole (13) of the fluid outlet means (10) is plugged with one or more particles, fluid can still escape through a passage formed by the recessed portion (11). In a preferred embodiment, the container (2) is further equipped with at least one projection (15) extending inwardly in the container (2) from a position near the hole (13) of the fluid outlet means (10). The projection (15) has a function in avoiding blockage of the entire hole (13), including the recessed portion (11), by a relatively large particle.
